

Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

-
1. (original): A computer instruction comprises:
a command instruction to issue a memory reference to an address in a memory shared among threads executing in microprocessors while a context of a thread is inactive.
2. (original): The instruction of claim 1 wherein the command instruction comprises a command field that sets or clears user-specified bits in a longword.
3. (original): The instruction of claim 1 wherein the command instruction comprises a command field that reads from the address to a transfer register associated with the microengines.
4. (original): The instruction of claim 1 wherein the command instruction comprises a command field that locks the memory and then reads the memory.
5. (original): The instruction of claim 1 wherein the command instruction comprises a command field that writes to the memory from a transfer register associated with the microengines.
6. (original): The instruction of claim 1 wherein the command instruction comprises a command field that writes to the address and unlocks the address.
7. (original): The instruction of claim 1 wherein the command instruction comprises a command field that pushes a list element specified by the address onto a specified stack.
8. (original): The instruction of claim 1 wherein the command instruction comprises a command field that pops a list element specified by the address from a specified stack.

9. (original): The instruction of claim 1 further comprising:

a transfer register specified as a parameter in the instruction.

10. (original): The instruction of claim 1 further comprising:

a first source operand field; and

a second source operand field.

11. (original): The instruction of claim 10 wherein the first source operand and the second source operand are context-relative registers.

12. (original): The instruction of claim 10 wherein the first source operand and the second source operand are 5-bit intermediate data ranging from +31 to 0.

13. (original): The instruction of claim 1 further comprising a reference count field specified as a parameter in the instruction.

14. (original): The instruction of claim 13 wherein the reference count field specifies a number of contiguous longwords in the memory to be referenced.

15. (original): The instruction of claim 1 further comprising a queue number as a parameter in the instruction.

16. (original): The instruction of claim 15 wherein the queue number specifies one of eight push/pop queues.

17. (original): The instruction of claim 1 further comprising a bit operand as a parameter in the instruction.

18. (original): The instruction of claim 17 wherein the bit operand sets or clear bits at an address using a specified bit mask.

19. (original): The instruction of claim 1 further comprising:

an optional token that is set by a programmer.

20. (original): The instruction of claim 19 wherein the optional token causes the instruction to signal a corresponding micro-engine/thread pair that is sourcing or sinking memory data when complete.

21. (original): The instruction of claim 19 wherein the optional token swaps out a context of a current thread execution to let another thread context execute.

22. (original): The instruction of claim 19 wherein the optional token swaps out a current context thread after execution of one instruction.

23. (original): The instruction of claim 19 wherein the optional token places a memory reference into an ordered queue.

24. (original): The instruction of claim 19 wherein the optional token places a memory reference into a priority queue.

25. (original): The instruction of claim 19 wherein the optional token optimizes memory bandwidth by placing the memory reference into a read or ordered queue.

26. (original): The instruction of claim 19 wherein the optional token indicates overriding qualifiers.

27. (original): The instruction of claim 1 wherein the memory is a synchronous dynamic random access memory (SDRAM).

28. (original): The instruction of claim 1 wherein the memory is a synchronous random access memory (SRAM).

29. (original): The instruction of claim 1 wherein the memory is a scratch pad memory.

30. (original): A method of operating a processor comprising:

issuing a command to a memory shared among threads executing in microprocessors, each thread having an associated context; and

inactivating the context of the thread issuing the command while the command is executing.

31. (original): The method of claim 30 wherein the command comprises:

setting user-specified bits in a longword.

32. (original): The method of claim 30 wherein the command comprises:

clearing user-specified bits in a longword.

33. (original): The method of claim 30 further comprising:

providing an address in the memory to affect a change.

34. (original): The method of claim 33 wherein the command comprises:

locking the memory.

35. (original): The method of claim 34 wherein the command further comprises:

reading from the address to a transfer register associated with the microprocessors.

36. (original): The method of claim 33 further comprising:

unlocking the memory; and

writing to the address from a transfer register associated with the microprocessors.
